QuickBooks Changes in 2019 version

With the Quickbooks 2019 release, Intuit is now validating their iif import file, resulting in errors for use of commas at the end of each line among other validations.

File not imported

 **We weren't able to import your file**

Imported file name : invoices_15102021_1243_16.iif

ITEMS	SUCCESS	FAILED
Lists	0	ALL
Transactions	0	ALL

What's Next ?

- We've created a new IIF file for failed records with error info
- Select **Review Now** to open and fix the errors or select **Open in folder** to view where this file is saved
- Save and re-import this file once you've corrected the errors

File name : invoices_15102021_1243_16_1015125331.iif
Location : C:\Program Files (x86)\Intuit\QuickBooks 2021

[Review now](#) [Open in folder](#) [Close](#)

To support older file versions, they have provided a way to skip the new validation and simply do the import. Instead of clicking the button to import, click the link on the bottom of the form (see image below).

Note:

- Ensure you don't use commas, periods or quotes in company name, showname or any products so that the import goes smoothly.
- Accounts 22 should have last 4 chars of GL codes, Product setup Revenue Code on General tab uses 4 chars also. QuickBooks can have 8 chars and still will find the match during import.

Here are the menu options in QuickBooks:
